

films are deposited in the first contact hole and on the upper part, the second insulating oxide layer is formed. Next, the second contact hole is formed on the upper part of the first contact hole and on the areas predetermined for the establishment of the contact holes. Then, the second contact hole becomes almost filled with the selective tungsten thin films, thus achieving better step coverage of metal wire at the contact holes.

Although this invention has been described in its preferred forms with a certain degree of particularity, it will be appreciated by those skilled in the art that the present disclosure of the preferred forms has been effected only by way of example, and that numerous changes in the details of the construction, combination and arrangement of parts may be resorted to without departing from the spirit and scope of the invention.

What is claimed is:

1. A method for filling contact holes with metal by two-step deposition of metal layers, said method comprising the steps of:

- providing a silicon substrate;
- forming a field oxide layer and a junction layer and gate electrode on said silicon substrate;
- forming a first insulating layer on exposed portions of the field oxide layer, the junction layer, and the gate electrode;
- forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said gate electrode, respectively the first plurality of contact holes having a tapered upper portion;
- filling a first metal layer into the first plurality of contact holes, entirely, the first metal layer being grown over and extending slightly beyond said first plurality of contact holes;
- forming a conductive layer pattern on the first insulating layer spaced from said first metal layer;
- forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;
- forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first metal layer and the conductive layer pattern, respectively and
- filling a second metal layer into said second plurality of contact holes to contact the first metal layer and the conductive layer pattern, respectively.

2. A method according to claim 1, wherein the first metal layer and subsequently the second metal layer are formed by chemical vapor deposition method.

3. A method according to claim 1, wherein the second metal layer filled in each of the second plurality of contacts holes has substantially equal depth.

4. A method according to claim 1, wherein the first and second metal layers are selective tungsten layers, respectively, and the first and second plurality of contact holes are filled with the first and second metal layers of the selected tungsten layers, respectively.

5. A method for filling contact holes with metal by a two-step deposition of metal layers, said method comprising the steps of:

- providing a silicon substrate;

6620T" 9224E460

6

forming a conductive layer pattern on the first insulating layer spaced from said first metal layer;
 forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;
 forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first metal layer and the conductive layer pattern, respectively and
 filling a second metal layer into said second plurality of contact holes to contact the first metal layer and the conductive layer pattern, respectively.

6. A method of forming a substrate with contact holes, said method comprising:

providing a substrate;

forming an oxide layer, a junction layer and a gate electrode on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the junction layer, and the gate electrode;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said gate electrode, respectively, the first plurality of contact holes having a tapered upper portion;

forming a first conductive material layer into the first plurality of contact holes, entirely, the first conductive material layer being grown over and extending slightly beyond said first plurality of contact holes;

forming a conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the conductive layer pattern, respectively; and

forming a second conductive material layer into said second plurality of contact holes to contact the first conductive material layer and the conductive layer pattern, respectively.

7. A method according to claim 1, wherein the first conductive material layer and subsequently the second conductive

material layer are formed by a chemical vapor deposition process.

5ub
B2
contd

8. A method according to claim 1, wherein the second conductive material layer filled in each of the second plurality of contacts holes has substantially equal depth.

9. A method according to claim 1, wherein the first and second conductive material layers comprise first and second tungsten layers, respectively, and the first and second plurality of contact holes are filled with the first and second tungsten layers, respectively.

✓ 10. A method of forming a substrate with contact holes, said method comprising:

providing a substrate;

forming an oxide layer, a junction layer and a gate electrode on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the junction layer, and the gate electrode;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said gate electrode, respectively, the first plurality of contact holes having a tapered upper portion;

forming a first conductive material layer into entire first plurality of contact holes in a continuous step, the first conductive material layer being grown over and extending slightly beyond said first plurality of contact holes;

forming a conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

552047 9242460

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the conductive layer pattern, respectively; and

forming a second conductive material layer into said second plurality of contact holes to contact the first conductive material layer and the conductive layer pattern, respectively.

11. A method according to claim 10, wherein said steps of forming said first and said second conductive material layers comprise filling said first and said second plurality of contact holes, respectively.

12. A method of forming a substrate with contact holes filled by multi-step deposition of conductive layers, said method comprising:

providing a substrate;

forming an oxide layer and a junction layer on said substrate;

forming a first insulating layer on exposed portions of the oxide layer and the junction layer;

forming a first contact hole by removing a portion of the first insulating layer to expose said junction layer, the first contact hole having a tapered upper portion;

forming a first conductive material layer into the first contact hole, entirely;

forming a conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first contact hole;

forming a second contact hole by removing portions of said second insulating layer to expose the first conductive

material layer; and

forming a second conductive material layer into said second contact hole to contact the first conductive material layer.

13. A method as in claim 12, further comprising:
forming a third contact hole by removing portions of the second insulating layer to expose the conductive layer pattern; and

forming the second conductive material layer into the third contact hole to contact the conductive layer pattern.

14. A method as in claim 12, wherein said first and said second conductive material layers comprise a metal.

50434736-110299
SUB BY ✓ 15. A method of forming a semiconductor with contact holes filled by multi-step deposition of conductive layers, said method comprising:

providing a substrate;

forming an oxide layer and a gate electrode on said substrate;

forming a first insulating layer on exposed portions of the oxide layer and the gate electrode;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said gate electrode, the first plurality of contact holes having a tapered upper portion;

filling a first conductive material layer into the first plurality of contact holes, entirely;

forming a conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and

the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the conductive layer pattern; and

filling a second conductive material layer into said second plurality of contact holes to contact the first conductive material layer and the conductive layer pattern.

16. A method as in claim 15, wherein said first and second conductive material layers comprise first and second metal layers.

17. A method of forming a semiconductor with contact holes filled by multi-step deposition of conductive material layers, said method comprising:

providing a substrate;

forming an oxide layer and a first conductive layer pattern on said substrate;

forming a first insulating layer on exposed portions of the oxide layer and the first conductive layer pattern;

forming a first contact hole by removing a portion of the first insulating layer to expose said first conductive layer pattern, the first contact hole having a tapered upper portion;

forming a first conductive material layer into the first contact hole, filling said first contact hole entirely;

forming a second conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions of the second conductive layer pattern, the first insulating layer, and the first conductive material layer;

forming second and third contact holes of substantially equal depth by removing portions of said second insulating layer

to expose both the first conductive material layer and the second conductive layer pattern, respectively; and

forming a second conductive material layer into said second and third contact holes to contact the first conductive material layer and the second conductive layer pattern, respectively.

18. A method as in claim 17, wherein said first conductive layer pattern comprises a gate electrode.

19. A method as in claim 17, wherein said first and second conductive material layers comprise first and second metal layers.

20. A method of forming a semiconductor with contact holes filled by multi-step deposition of conductive layers, said method comprising:

providing a substrate;

forming an oxide layer, a junction layer and a first conductive layer pattern on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the junction layer, and the first conductive layer pattern;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said first conductive layer pattern, respectively, the first plurality of contact holes having a tapered upper portion;

filling a first conductive material layer into the first plurality of contact holes, entirely;

forming a second conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions

of the second conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the second conductive layer pattern, respectively; and

filling a second conductive material layer into said second plurality of contact holes to contact the first conductive material layer and the second conductive layer pattern, respectively.

21. A method as in claim 20, wherein said first and second conductive material layers comprise first and second metal layers.

22. A method as in claim 20, wherein said first conductive layer pattern comprises a gate electrode.

✓ 23. A method of forming a semiconductor with contact holes filled by multi-step deposition of conductive layers, said method comprising:

providing a substrate;

forming an oxide layer, and first and second regions on said substrate;

forming a first insulating layer on exposed portions of the oxide layer and said first and said second regions;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said first and second regions, the first plurality of contact holes having a tapered upper portion;

forming a first conductive material layer into, and filling entirely, the first plurality of contact holes;

forming a conductive layer pattern on the first insulating layer spaced from said first conductive material

layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first conductive material layer;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the conductive layer pattern; and

forming a second conductive material layer into said second plurality of contact holes to contact the first conductive material layer and the conductive layer pattern.

24. A method as in claim 23, wherein said first region comprises a junction layer.

25. A method as in claim 23, wherein said second region comprises a gate electrode.

26. A method as in claim 23, wherein said first and second conductive material layers comprise first and second metal layers.

5620TT 9244650
27. A method of forming a semiconductor with contact holes filled by multi-step deposition of conductive layers, said method comprising:

providing a substrate;

forming an oxide layer, a junction layer and a gate electrode on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the junction layer, and the gate electrode;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said gate electrode, respectively;

forming a first conductive material layer into the first plurality of contact holes, entirely;

forming a conductive layer pattern on the first insulating layer spaced from said first conductive material layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the conductive layer pattern; and

forming a second conductive material layer into said second plurality of contact holes to contact the first conductive material layer and the conductive layer pattern.

28. A method as in claim 27, wherein said first and second conductive material layers comprise first and second metal layers.

29. A method as in claim 27, wherein said first plurality of contact holes have a tapered upper portion.

30. A method of forming a semiconductor with contact holes filled by multi-step deposition of metal layers, said method comprising:

providing a substrate;

forming an oxide layer and a junction layer on said substrate;

forming a first insulating layer on exposed portions of the oxide layer and the junction layer;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer, the first

5520T" 92242460

plurality of contact holes having a tapered upper portion;
forming a first metal layer into the first plurality of
contact holes, entirely;
forming a conductive layer pattern on the first
insulating layer spaced from said first metal layer;
forming a second insulating layer on exposed portions
of the conductive layer pattern, the first insulating layer, and
the first plurality of contact holes;
forming second plurality of contact holes of
substantially equal depth by removing portions of said second
insulating layer to expose both the first metal layer and the
conductive layer pattern, respectively; and
forming a second metal layer into said second plurality
of contact holes to contact the first metal layer and the
conductive layer pattern, respectively.

✓31. A method of forming a semiconductor with contact
holes filled by multi-step deposition of metal layers, said
method comprising:

providing a substrate;
forming an oxide layer and a gate electrode on said
substrate;
forming a first insulating layer on exposed portions of
the oxide layer and the gate electrode;
forming first plurality of contact holes of
substantially equal depth by removing portions of the first
insulating layer to expose said gate electrode, the first
plurality of contact holes having a tapered upper portion;
filling a first metal layer into the first plurality of
contact holes, entirely;
forming a conductive layer pattern on the first
insulating layer spaced from said first metal layer;
forming a second insulating layer on exposed portions
of the conductive layer pattern, the first insulating layer, and

the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first metal layer and the conductive layer pattern, respectively; and

filling a second metal layer into said second plurality of contact holes to contact the first metal layer and the conductive layer pattern, respectively.

32. A method of forming a semiconductor with contact holes filled by multi-step deposition of metal layers, said method comprising:

providing a substrate;

forming an oxide layer and a first conductive layer pattern on said substrate;

forming a first insulating layer on exposed portions of the oxide layer and the first conductive layer pattern;

forming a first contact hole by removing a portion of the first insulating layer to expose said first conductive layer pattern, the first contact hole having a tapered upper portion;

forming a first metal layer into the first plurality of contact hole, entirely;

forming a second conductive layer pattern on the first insulating layer spaced from said first metal layer;

forming a second insulating layer on exposed portions of the second conductive layer pattern, the first insulating layer, and the first contact hole;

forming second and third contact holes of substantially equal depth by removing portions of said second insulating layer to expose the first metal layer and the second conductive layer pattern, respectively; and

forming a second metal layer into said second and third contact holes to contact the first metal layer and the second conductive layer pattern, respectively.

33. A method as in claim 32, wherein said first conductive layer pattern comprises a gate electrode.

34. A method of forming a semiconductor with contact holes filled by multi-step deposition of metal layers, said method comprising:

providing a substrate;

forming an oxide layer and a junction layer and first conductive layer pattern on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the junction layer, and the first conductive layer pattern;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said first conductive layer pattern, respectively, the first plurality of contact holes having a tapered upper portion;

forming a first metal layer into the first plurality of contact holes, entirely;

forming a second conductive layer pattern on the first insulating layer spaced from said first metal layer;

forming a second insulating layer on exposed portions of the second conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first metal layer and the second conductive layer pattern, respectively; and

forming a second metal layer into said second plurality of contact holes to contact the first metal layer and the second conductive layer pattern, respectively.

35. A method as in claim 34, wherein said first

conductive layer pattern comprises a gate electrode.

✓ 36. A method of forming a semiconductor with contact holes filled by multi-step deposition of metal layers, said method comprising:

providing a substrate;

forming an oxide layer, and first and second regions on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the first region and the second region;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said first and said second region, respectively, the first plurality of contact holes having a tapered upper portion;

forming a first metal layer into the first plurality of contact holes, to fill said first plurality of contact holes entirely;

forming a conductive layer pattern on the first insulating layer spaced from said first metal layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first metal layer and the conductive layer pattern, respectively; and

forming a second metal layer into said second plurality of contact holes to contact the first metal layer and the conductive layer pattern, respectively.

37. A method as in claim 36, wherein said first region comprises a junction layer.

38. A method as in claim 36, wherein said second region comprises a gate electrode

39. A method of forming a semiconductor with contact holes filled by multi-step deposition of metal layers, said method comprising:

providing a substrate;

forming an oxide layer, a junction layer and a gate electrode on said substrate;

forming a first insulating layer on exposed portions of the oxide layer, the junction layer, and the gate electrode;

forming first plurality of contact holes of substantially equal depth by removing portions of the first insulating layer to expose said junction layer and said gate electrode, respectively;

forming a first metal layer into the first plurality of contact holes, to fill said first plurality of contact holes entirely;

forming a conductive layer pattern on the first insulating layer spaced from said first metal layer;

forming a second insulating layer on exposed portions of the conductive layer pattern, the first insulating layer, and the first plurality of contact holes;

forming second plurality of contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first metal layer and the conductive layer pattern, respectively; and

forming a second metal layer into said second plurality of contact holes to contact the first metal layer and the conductive layer pattern, respectively.

40. A method as in claim 39, wherein said first plurality of contact holes have a tapered upper portion.

Sub
EX

41. A method of forming a semiconductor with contact holes filled by multi-step deposition of conductive material layers, said method comprising:
providing a substrate;
forming an oxide layer and a first conductive layer pattern on said substrate;
forming a first insulating layer on exposed portions of the oxide layer and the first conductive layer pattern;
forming a first contact hole by removing portions of the first insulating layer to expose said first conductive layer pattern;
forming a first conductive material layer into the first contact hole, entirely;
forming a second conductive layer pattern on the first insulating layer spaced from said first metal layer;
forming a second insulating layer on exposed portions of the second conductive layer pattern, the first insulating layer, and the first contact hole;
forming second and third contact holes of substantially equal depth by removing portions of said second insulating layer to expose both the first conductive material layer and the second conductive layer pattern, respectively; and
forming a second conductive material layer into said second and said third contact holes to contact the first conductive material layer and the second conductive layer pattern, respectively.

42. The method of claim 41, wherein said first conductive material layer comprises a metal.

43. The method of claim 42, wherein said metal comprises tungsten.

44. The method of claim 41, wherein said first

562071 9E24E460
conductive material layer comprises polysilicon.

45. The method of claim 41, wherein said first conductive layer pattern comprises a gate electrode.

46. The method of claim 41, wherein said first conductive layer pattern comprises a gate electrode overlying a gate oxide.

47. The method of claim 41, further comprising a junction layer on said substrate.

48. The method of claim 47, wherein said junction layer comprises a N+ junction layer.

49. The method of claim 47, wherein said junction layer comprises a P+ junction layer.

50. The method of claim 41, wherein said first conductive layer pattern comprises polysilicon.

51. The method of claim 41, wherein said first insulating layer comprises a first oxide layer.

52. The method of claim 41, wherein said step of forming said first contact hole comprises a photoresist process.

53. The method of claim 41, wherein said step of forming said first contact hole comprises a wet etch process.

54. The method of claim 41, wherein said step of forming said first contact hole comprises a dry etch process.

55. The method of claim 47, wherein said step of

forming said first contact hole further exposes said junction layer.

] 112 2nd.

56. The method of claim 41, wherein said first contact hole has a tapered upper portion.

57. The method of claim 41, wherein said step of forming said first conductive material layer comprises a CVD process.

58. The method of claim 41, wherein said second conductive layer pattern comprises polysilicon.

59. The method of claim 41, wherein said second insulating layer comprises a second oxide layer.

60. The method of claim 41, wherein said step of forming said second and said third contact holes comprises a photoresist process.

61. The method of claim 41, wherein said step of forming said second and said third contact holes comprises a wet etch process.

62. The method of claim 41, wherein said step of forming said second and said third contact holes comprises a dry etch process.

63. The method of claim 41, wherein said step of forming said second conductive material layer comprises a CVD process.

64. A semiconductor device comprising:
a semiconductor substrate having an oxide layer, a

662017 " 9524E460

junction layer and a gate electrode;

a first insulating layer overlying portions of said oxide layer, said junction layer and said gate electrode, said first insulating layer having a first plurality of contact holes of substantially equal depth over said junction layer and said gate electrode, said first plurality of contact holes having a tapered upper portion;

a first metal layer filling said first plurality of contact holes so that said first metal layer is in contact with said junction layer and said gate electrode;

a conductive layer pattern on said first insulating layer spaced apart from said first metal layer;

a second insulating layer overlying portions of said conductive layer pattern, said first insulating layer and said first plurality of contact holes, said second insulating layer having a second plurality of contact holes of substantially equal depth over said first metal layer and said conductive layer pattern; and

a second metal layer filling said second plurality of contact holes, said second metal layer in contact with said first metal layer and said conductive layer pattern.

✓65. A semiconductor device comprising:

a semiconductor substrate having an oxide layer, a junction layer and a gate electrode;

a first insulating layer overlying portions of said oxide layer, said junction layer and said gate electrode, said first insulating layer having a first plurality of contact holes of substantially equal depth over said junction layer and said gate electrode, said first plurality of contact holes having a tapered upper portion;

a first conductive material layer filling said first plurality of contact holes so that said first conductive material layer is in contact with said junction layer and said gate

electrode;

a conductive layer pattern on said first insulating layer spaced apart from said first conductive material layer;

a second insulating layer overlying portions of said conductive layer pattern, said first insulating layer and said first plurality of contact holes, said second insulating layer having a second plurality of contact holes of substantially equal depth over said first conductive material layer and said conductive layer pattern; and

a second conductive material layer filling said second plurality of contact holes, said second conductive material layer in contact with said first conductive material layer and said conductive layer pattern.

66. A semiconductor device comprising:

a semiconductor substrate having an oxide layer and a first conductive layer pattern;

a first insulating layer overlying portions of said oxide layer and said first conductive layer pattern, said first insulating layer having a first plurality of contact holes of substantially equal depth over said first conductive layer pattern;

a first conductive material layer filling said first plurality of contact holes so that said first conductive material layer is in contact with said first conductive layer pattern;

a second conductive layer pattern on said first insulating layer spaced apart from said first conductive material layer;

a second insulating layer overlying portions of said second conductive layer pattern, said first insulating layer and said first plurality of contact holes, said second insulating layer having a second plurality of contact holes of substantially equal depth over said first conductive material layer and said second conductive layer pattern; and

a second conductive material layer filling said second plurality of contact holes, said second conductive material layer in contact with said first conductive material layer and said second conductive layer pattern.

67. The device of claim 66, wherein said conductive material layers comprise a metal.

68. The device of claim 67, wherein said metal comprises tungsten.

69. The device of claim 66, wherein said first conductive layer pattern comprises a gate electrode.

70. The device of claim 66, wherein said first conductive layer pattern comprises a gate electrode overlying a gate oxide.

71. The device of claim 66, wherein said first conductive material layer comprises polysilicon.

72. The device of claim 66, further comprising a junction layer on said substrate.

73. The device of claim 72, wherein said junction layer comprises a N+ junction layer.

74. The device of claim 72, wherein said junction layer comprises a P+ junction layer.

75. The device of claim 66, wherein said first conductive layer pattern comprises polysilicon.

76. The device of claim 66, wherein said first

insulating layer comprises a first oxide layer.

77. The device of claim 66, wherein said first plurality of contact holes are formed by a photoresist process.

78. The device of claim 66, wherein said first plurality of contact holes are formed by a wet etch process.

79. The device of claim 66, wherein said first plurality of contact holes are formed by a dry etch process.

80. The device of claim 72, wherein said first plurality of contact holes expose said junction layer.

81. The device of claim 66, wherein said first plurality of contact holes have tapered upper portions.

82. The device of claim 66, wherein said first plurality of contact holes are formed by a CVD process.

83. The device of claim 66, wherein said second conductive layer pattern comprises polysilicon.

84. The device of claim 66, wherein said second insulating layer comprises a second oxide layer.

85. The device of claim 66, wherein said second plurality of contact holes are formed by a photoresist process.

86. The device of claim 66, wherein said second plurality of contact holes are formed by a wet etch process.
